Patch for MySQL Bug 15811 (MySQL v5.0.23)	What is this bug
 char *end=str+strlen(str); if (ismbchar(cs, str, end)) + if (ismbchar(cs, str, str + cs->mbmaxlen)) strings/ctype-mb.c 	ismbchar checks whether a string (2 nd param.) is coded by a specific character-set (1 st param).
A PPP we found in the latest version of MySQL	
 /* 'end' is only used in the ismbchar checking*/ for (end=s; *end; end++); if (ismbchar(mysqlcs, s, end)) 	Since ismbchar only checks the first CHARSET::mbmaxlen characters of a string, calculating the exact length &
+ if ($ismbchar(mysqlcs, s, s+mysqlcs \rightarrow mbmaxlen)$	range of a string is unnecessary.
libmysql/libmysql.c
